PIPELINE REPORT

YOUR MOVIE SUCKS! | Lab C | 3D track | Unity 6000.3.8f1 / URP 17.3.0

Updated with author-confirmed group timings, scores and disclosed spend (31 Oct 2026). Other hours, non-AI estimates, plan tiers and asset permissions remain unverified. The 3D track substitutes two visible enemies for an invisible first-person player; instructor approval is not confirmed.

Stage summary

Stage	AI 1–5	Time	Evidence / outcome
Art direction	[not scored]	Not separately measured	Overkill-inspired grindhouse / PS1 vision; readable typing targets
Concept / turnaround	4/5	60 min	Gemini: bikini and bartender zombie sheets
Modeling	4/5	30 min	Tripo: two zombies and central stage
Texturing / shaders	5/5 (shader)	30 min (shader only)	Tripo textures; SP/Photoshop edits; ChatGPT → Astra shader
Rigging / animation	5/5	10 min combined	Mixamo rig and prebuilt zombie motions
Environment / lighting	4/5	8 min combined	Agent-created blockout, manually revised lighting/materials
UI / VFX	3/5 (UI)	40 min (UI only)	Photoshop-cleaned HUD; AI-built editor; screen blood/claws
Integration / testing	4/5	180 min	Windows builds; qualitative playtests and repo logs
SFX (5 stages)	N/A	Not reported	Traditional sources; four trigger categories documented
Music (4 stages)	N/A	Not reported	Existing singer's commercial track (~4 min); rights unverified, 30–90s requirement not met; retained for interim coursework build
Voice (6 stages)	N/A	Not reported	Human voice actor; 13 captioned lines in game, 10 unused

Three strongest documented contributions

1. PS1 shader implementation (ChatGPT + Astra; 5/5, 30 min): the artist specified vertex snapping and affine-like UV behavior; AI translated the brief into implementation. 2. Mixamo rigging and animation (5/5, 10 min combined):

efficiently reused automated humanoid rigging and animation assets. 3. Gemini concept development and Tripo 3D generation (both 4/5; 60 and 30 min): two enemy turnarounds and corresponding low-detail meshes fit the project's deliberately retro visual target.

Three limits or trade-offs

1. HUD editor (3/5, 40 min): the AI-built preview canvas did not match actual game proportions, requiring repeated correction. 2. Music/SFX content: the author deliberately used existing recordings instead of generated audio; this is a creative sourcing decision, not evidence of a measured AI failure. 3. Asset cleanup and play-size judgment: generated meshes/textures still needed human review and occasional Substance/Photoshop touch-ups. These are constraints rather than three independently measured unsuccessful AI trials.

Producer recommendation and unresolved risks

In a five-person studio, I would use AI for character turnarounds, quick stylized model prototypes, shader implementation and code integration, while maintaining human art direction, audio sourcing and casting. I would not use an AI agent to replace straightforward scene lighting: here it added little value and manual work would have been faster and better. I would also require visual checking for UI tools: their preview coordinate system may disagree with the game canvas. The time comparison above is deliberately partial. Source permissions, music duration, and Windows-vs-browser delivery remain to be checked. *The current coursework build retains a singer's full commercial house recording (~4:00); its game/redistribution rights have not been verified and it exceeds the 30–90-second music requirement. No replacement was made at the author's request. Public GitHub access, including file history, creates an additional distribution concern. This should be resolved before wider distribution.*

Confirmed work-group total: 358 minutes (5 h 58 min), across seven recorded groups. Author-estimated alternatives: concept art 240 min (vs 60); adapting two sourced PS1 models 240 min (vs 30); Mixamo 10 min (vs 10); basic UI 60 min (vs 40); integration/testing 180 min (vs 180). These five comparable groups total 730 min estimated without AI vs 320 min observed: an illustrative difference of 410 min (6 h 50 min), NOT a complete-project net saving. PS1 shader: author cannot independently deliver an equivalent result, so no baseline; scene/lighting: author says manual would be faster than 8 min and look better (no exact estimate). UI manual version lacks the custom editor. All alternatives are subjective estimates, not timed experiments. Disclosed spend: approximately RMB 160 + USD 20, with no FX conversion.

Evidence: attached Gemini turnarounds, Tripo models, Mixamo viewport, before/after images, HUD editor and variants; project GitHub files GDD.md, ASSET_LOG.md, BUILD_LOG.md, docs/sound-list.md and docs/voice-script.md.
